

Scenario:

You just pulled into the parking lot at your place of work. You would like to be able to find where you parked when you leave without having to use a car alarm.

Task 1: Sign up for an account to use the app

Task 2: Figure out how many miles you have traveled in the past month.

Task 3: Find where you parked, and figure out in which direction to go.

Notes:

Changes to be made:

- 1) Make the map more clear, hard to discern things.
- 2) Make the direction of the map more obvious, somewhat hard to see in which direction you should start walking.
- 3) Clarify what the traffic signal on the home page means, or take it out.

Things to keep the same:

- 1) Login and sign up screen are very user friendly.
- 2) Miles traveled screen has lots of data.
- 3) MPG screen has lots of data.
